

Propositional Logic - Syntactic Sugar

$\varphi \Leftrightarrow \psi := (\neg\varphi \vee \psi) \wedge (\neg\psi \vee \varphi)$ $\varphi \rightarrow \psi := \neg\varphi \vee \psi$

$\varphi \oplus \psi := (\varphi \wedge \neg\psi) \vee (\psi \wedge \neg\varphi)$ $\varphi \bar{\wedge} \psi := \neg(\varphi \wedge \psi)$

$(\alpha \Rightarrow \beta | \gamma) := (\neg\alpha \vee \beta) \wedge (\alpha \vee \gamma)$ $\varphi \bar{\vee} \psi := \neg(\varphi \vee \psi)$

Satisfiability, Validity and Equivalence

$\text{SAT}(\varphi) := \neg \text{VALID}(\neg\varphi)$ $\varphi \Leftrightarrow \psi := \text{VALID}(\varphi \leftrightarrow \psi)$

$\text{VALID}(\varphi) := (\varphi \Leftrightarrow 1)$ $\text{SAT}(\varphi) := \neg(\varphi \Leftrightarrow 0)$.

Conjunctive Normal Form: from truth table, take minterms that are 0. Each minterm is built as an OR of the negated variables. E.g.,

$(0, 0, 1) \rightarrow (x \vee y \vee \neg z)$.

Distributivity: $a \wedge (b \vee c) = (a \wedge b) \vee (a \wedge c)$

$a \vee (b \wedge c) = (a \vee b) \wedge (a \vee c)$

Sequent Calculus:

1. Prove validity of ϕ : start with $\{\} \vdash \phi$; ϕ is valid iff $\Gamma \cap \Delta \neq \{\}$ for all leaves; else, counterexample: var is true, if $x \in \Gamma$; false otherwise; "don't care", if variable doesn't appear.
2. Prove satisfiability of ϕ : start with $\{\phi\} \vdash \{\}$; ϕ is satisfiable iff $\Gamma \cap \Delta = \{\}$ for at least one leaf. Satisfying interpretation: same as counterexample.

OPER.	LEFT	RIGHT
NOT	$\neg\phi, \Gamma \vdash \Delta$ $\Gamma \vdash \phi, \Delta$	$\Gamma \vdash \neg\phi, \Delta$ $\neg\phi, \Gamma \vdash \Delta$
AND	$\phi \wedge \psi, \Gamma \vdash \Delta$ $\phi, \psi, \Gamma \vdash \Delta$	$\Gamma \vdash \phi \wedge \psi, \Delta$ $\Gamma \vdash \phi, \Delta$ $\Gamma \vdash \psi, \Delta$
OR	$\phi \vee \psi, \Gamma \vdash \Delta$ $\phi, \Gamma \vdash \Delta$ $\psi, \Gamma \vdash \Delta$	$\Gamma \vdash \phi \vee \psi, \Delta$ $\Gamma \vdash \phi, \psi, \Delta$

Resolution Calculus

$\frac{\{ \neg x \} \cup C_1 \quad \{ x \} \cup C_2}{C_1 \cup C_2}$
To prove unsatisfiability of given clauses in CNF: If we reach $\{\}$, the formula is unsatisfiable. E.g., $\{\{a\}, \{\neg a, b\}, \{\neg b\}\}$, we get:

$\{a\} + \{\neg a, b\} \rightarrow \{b\}$; $\{b\} + \{\neg b\} \rightarrow \{\}$ (unsatisfiable).

To prove validity, prove UNSAT of negated formula.

Linear Clause Forms (Computes CNF)

Bottom up in the syntax tree: convert "operators and variables" into new variable. E.g., $\neg a \vee b$ becomes $x_1 \leftrightarrow \neg a$; $x_2 \leftrightarrow x_1 \vee b$. Use rules below to find CNF.

$$x \leftrightarrow \neg y \Leftrightarrow (\neg x \vee \neg y) \wedge (x \vee y)$$

$$x \leftrightarrow y_1 \wedge y_2 \Leftrightarrow (\neg x \vee y_1) \wedge (\neg x \vee y_2) \wedge (x \vee \neg y_1 \vee \neg y_2)$$

$$(x \vee \neg y_1 \vee \neg y_2)$$

$$x \leftrightarrow y_1 \vee y_2 \Leftrightarrow (\neg x \vee y_1 \vee y_2) \wedge (x \vee \neg y_1) \wedge (x \vee \neg y_2)$$

$$(x \vee \neg y_1) \wedge (x \vee \neg y_2)$$

$$x \leftrightarrow y_1 \rightarrow y_2 \Leftrightarrow (x \vee y_1) \wedge (x \vee \neg y_1 \vee \neg y_2) \wedge (\neg x \vee \neg y_1 \vee y_2)$$

$$(\neg x \vee \neg y_1 \vee y_2)$$

$$x \leftrightarrow (y_1 \leftrightarrow y_2) \Leftrightarrow (x \vee y_1 \vee y_2) \wedge (x \vee \neg y_1 \vee \neg y_2) \wedge (\neg x \vee y_1 \vee \neg y_2) \wedge (\neg x \vee \neg y_1 \vee y_2)$$

$$(\neg x \vee y_1 \vee \neg y_2) \wedge (\neg x \vee \neg y_1 \vee y_2)$$

$$x \leftrightarrow y_1 \oplus y_2 \Leftrightarrow (x \vee \neg y_1 \vee y_2) \wedge (x \vee y_1 \vee \neg y_2) \wedge (\neg x \vee y_1 \vee y_2) \wedge (\neg x \vee \neg y_1 \vee \neg y_2)$$

$$(\neg x \vee y_1 \vee y_2) \wedge (\neg x \vee \neg y_1 \vee \neg y_2)$$

Davis Putnam Procedure - proves SAT; To prove validity: prove unsatisfiability of negated formula. **(1)** Compute Linear Clause Form

(Don't forget to create the last clause $\{x_n\}$) **(2)** Last variable has to be \perp (true) \rightarrow find implied variables.

(3) For remaining variables: assume values and

compute newly implied variables. **(4)** If

contradiction reached: backtrack.

Simulation:

given $K_1 = (I_1, S_1, R_1, L_1)$ and $K_2 = (I_2, S_2, R_2, L_2)$; $\sigma \subseteq S_1 \times S_2$ is a sim. relation between K_1 and K_2 ($K_1 \preceq K_2$) if: **SIM1-** $(s_1, s_2) \in \sigma$ implies $L_1(s_1) = L_2(s_2)$; **SIM2-** for $s_1, s'_1 \in S_1, s_2 \in S_2$ with $(s_1, s_2) \in \sigma$ and $(s_1, s'_1) \in R_1$, there must be $s'_2 \in S_2$ with $(s'_1, s'_2) \in \sigma$ ($s_2, s'_2 \in R_2$); **SIM3-** for all $s_1 \in I_1$, there is a $s_2 \in I_2$ with $(s_1, s_2) \in \sigma$.

Greatest Simulation Relation

$(s_1, s_2) \in \mathcal{H}_0 \Leftrightarrow L_1(s_1) = L_2(s_2)$

$(s_1, s_2) \in \mathcal{H}_{i+1} \Leftrightarrow$

$\left(\begin{array}{l} (s_1, s_2) \in \mathcal{H}_i \wedge \\ \forall s'_1 \in S_1. \exists s'_2 \in S_2. \\ (s_1, s'_1) \in R_1 \rightarrow (s_2, s'_2) \in R_2 \wedge (s'_1, s'_2) \in \mathcal{H}_i \end{array} \right)$

\mathcal{H}_* is the greatest simulation relation if **SIM3:** $I_1 \subseteq \{s_1 \in S_1 | \exists s_2 \in I_2. (s_1, s_2) \in \mathcal{H}_*\}$

Bisimulation: $\sigma \subseteq S_1 \times S_2$ is a bisim. relation between K_1 and K_2 ($K_1 \approx K_2$) if: **BISIM1-** $(s_1, s_2) \in \sigma$ implies $L_1(s_1) = L_2(s_2)$; **BISIM2a-**

$(s_1, s'_1 \in S_1, s_2 \in S_2, (s_1, s_2) \in \sigma, (s_1, s'_1) \in R_1$, imply that there is $s'_2 \in S_2$ with $(s'_1, s'_2) \in \sigma$ and $(s_2, s'_2) \in R_2$; **BISIM2b-** $s_2, s'_2 \in S_2, s_1 \in S_1, (s_1, s_2) \in \sigma, (s_2, s'_2) \in R_2$, imply that there is $s'_1 \in S_1$ with $(s'_1, s'_2) \in \sigma$ and $(s_1, s'_1) \in R_1$; **BISIM3a-** for all $s_1 \in I_1$, there is a $s_2 \in I_2$ with $(s_1, s_2) \in \sigma$; **BISIM3b-** for all $s_1 \in I_2$, there is a $s_2 \in I_2$ with $(s_1, s_2) \in \sigma$.

Greatest Bisimulation Relation (Equivalence)

$(s_1, s_2) \in \mathcal{B}_0 \Leftrightarrow L_1(s_1) = L_2(s_2)$

$(s_1, s_2) \in \mathcal{B}_{i+1} \Leftrightarrow$

$\left(\begin{array}{l} (s_1, s_2) \in \mathcal{B}_i \wedge \\ \forall s'_1 \in S_1. \exists s'_2 \in S_2. \\ (s_1, s'_1) \in R_1 \rightarrow (s_2, s'_2) \in R_2 \wedge (s'_1, s'_2) \in \mathcal{B}_i \\ \forall s'_2 \in S_2. \exists s'_1 \in S_1. \\ (s_2, s'_2) \in R_2 \rightarrow (s_1, s'_1) \in R_1 \wedge (s'_1, s'_2) \in \mathcal{B}_i \end{array} \right)$

\mathcal{B}_* is the greatest simulation relation if

$I_1 \subseteq \{s_1 \in S_1 | \exists s_2 \in I_2. (s_1, s_2) \in \mathcal{B}_*\}$

$I_2 \subseteq \{s_2 \in S_2 | \exists s_1 \in I_1. (s_1, s_2) \in \mathcal{B}_*\}$

Quotient: given $\mathcal{K} = (I, S, R, L)$ and the equivalence relation $\sigma \subseteq S \times S$; Quotient structure

$\mathcal{K}_{/\sigma} = (\tilde{I}, \tilde{S}, \tilde{R}, \tilde{L})$: $\tilde{I} := \{\{s' \in S | (s, s') \in \sigma\} | s \in I\}$

$\tilde{S} := \{\{s' \in S | (s, s') \in \sigma\} | s \in S\}$

$(\tilde{s}_1, \tilde{s}_2) \in \tilde{R} : \Leftrightarrow \exists s'_1 \in \tilde{s}_1. \exists s'_2 \in \tilde{s}_2. (s'_1, s'_2) \in R$

$\tilde{L}(\tilde{s}) := L(s)$

Symbolic Product Computation - given

$\mathcal{K}_1 = (V_1, \varphi_I, \varphi_R)$ and $\mathcal{K}_2 = (V_2, \psi_I, \psi_R)$, the product is: $\mathcal{K}_1 \times \mathcal{K}_2 = (V_1 \cup V_2, \varphi_I \wedge \psi_I, \varphi_R \wedge \psi_R)$

Quantif. $\exists x. \varphi := [\varphi]_x^1 \vee [\varphi]_x^0 \quad \forall x. \varphi := [\varphi]_x^1 \wedge [\varphi]_x^0$

Predecessor and Successor

$\diamond := \text{pre}_{\exists}^R(Q) := \exists x'_1, \dots, x'_n. \varphi_R \wedge [\varphi_Q]_{x'_1, \dots, x'_n}^{x'_1, \dots, x'_n}$

$\diamondsuit := \text{suc}_{\exists}^R(Q) := \exists x_1, \dots, x_n. \varphi_R \wedge \varphi_Q]_{x'_1, \dots, x'_n}^{x_1, \dots, x_n}$

$\square := \text{pre}_{\forall}^R(Q) := \forall x'_1, \dots, x'_n. \varphi_R \rightarrow [\varphi_Q]_{x'_1, \dots, x'_n}^{x'_1, \dots, x'_n}$

$\square\diamond := \text{suc}_{\forall}^R(Q) := \forall x_1, \dots, x_n. \varphi_R \rightarrow \varphi_Q]_{x'_1, \dots, x'_n}^{x_1, \dots, x_n}$

$\text{pre}_{\forall}^R(Q = \{S_1, \dots, S_n\})$ for each node n in \mathcal{K} : if n points to a node that is not in Q n $\notin \text{pre}_{\forall}^R(Q)$ else n $\in \text{pre}_{\forall}^R(Q)$	$\text{suc}_{\forall}^R(Q = \{S_1, \dots, S_n\})$ for each node n in \mathcal{K} : if n is pointed by a node that is not in Q n $\notin \text{suc}_{\forall}^R(Q)$ else n $\in \text{suc}_{\forall}^R(Q)$

Approximations and Ranks

If $(s, \mu x. \varphi)$ repeats \rightarrow return 1 $\text{apx}_0(\mu x. \varphi) := 0$

If $(s, \nu x. \varphi)$ repeats \rightarrow return 0 $\text{apx}_0(\nu x. \varphi) := 1$

$\text{apx}_{n+1}(\mu x. \varphi) := \lfloor \varphi \rfloor_x^{\text{apx}_n(\mu x. \varphi)}$

$\text{apx}_{n+1}(\nu x. \varphi) := \lfloor \varphi \rfloor_x^{\text{apx}_n(\nu x. \varphi)}$

Automata types: G \rightarrow Safety; F \rightarrow Liveness; FG \rightarrow Persistence/Co-Buchi; GF \rightarrow Fairness/Buchi.

Automaton Determinization

NDet_G \rightarrow Det_G: 1. Remove all states/edges that do not satisfy acceptance condition; 2. Use Subset construction (Rabin-Scott); 3. Acceptance condition will be the states where $\{\}$ is never reached.

{NDet_F(partial) or NDet_{prefix}} \rightarrow Det_{FG}: Breakpoint Construction.

NDet_F(total) \rightarrow Det_F: Subset Construction.

NDet_{FG} \rightarrow Det_{FG}: Breakpoint Construction.

NDet_{GF} \rightarrow {Det_{Rabin} or Det_{Streett}}: Safra Algorithm.

* **Breakpoint Construction 1.** Each state is composed by two components **2.** Initial state first component is a set of all initial states, and second component is the empty set. Ex.: $(I, \{\})$. **3.** a successor for a state (Q, Q_f) is generated as follows:

$\left\{ \begin{array}{l} \text{If } Q_f = \{\} \quad (\text{suc}_{\exists}^{\mathcal{R}_a}(Q), (\text{suc}_{\exists}^{\mathcal{R}_a}(Q) \cap \mathcal{F})) \\ \text{Otherwise} \quad (\text{suc}_{\exists}^{\mathcal{R}_a}(Q), (\text{suc}_{\exists}^{\mathcal{R}_a}(Q_f) \cap \mathcal{F})) \end{array} \right.$

4. Acceptance states are states where $Q_f \neq \{\}$.

Boolean Operations on ω -Automata

Complement

$\neg \mathcal{A}_{\forall}(Q, I, R, \mathcal{F}) = \mathcal{A}_{\exists}(Q, I, R, \neg \mathcal{F})$

$\neg \mathcal{A}_{\exists}(Q, I, R, \mathcal{F}) = \mathcal{A}_{\forall}(Q, I, R, \neg \mathcal{F})$

Conjunction

$(\mathcal{A}_{\exists}(Q_1, I_1, R_1, \mathcal{F}_1) \wedge \mathcal{A}_{\exists}(Q_2, I_2, R_2, \mathcal{F}_2)) = \mathcal{A}_{\exists}(Q_1 \cup Q_2, I_1 \wedge I_2, R_1 \wedge R_2, \mathcal{F}_1 \wedge \mathcal{F}_2)$

Disjunction

$(\mathcal{A}_{\exists}(Q_1, I_1, R_1, \mathcal{F}_1) \vee \mathcal{A}_{\exists}(Q_2, I_2, R_2, \mathcal{F}_2)) = \mathcal{A}_{\exists}(Q_1 \cup Q_2, I_1 \wedge I_2, R_1 \wedge R_2, \mathcal{F}_1 \vee \mathcal{F}_2)$

$\mathcal{A}_{\exists} \left(\begin{array}{l} Q_1 \cup Q_2 \cup \{q\}, \\ (\neg q \wedge I_1) \vee (q \wedge I_2), \\ (\neg q \wedge R_1 \wedge \neg q') \vee (q \wedge R_2 \wedge q'), \\ (\neg q \wedge F_1) \vee (q \wedge F_2) \end{array} \right)$

If both automata are totally defined,

$(\mathcal{A}_{\exists}(Q_1, I_1, R_1, \mathcal{F}_1) \vee \mathcal{A}_{\exists}(Q_2, I_2, R_2, \mathcal{F}_2)) = \mathcal{A}_{\exists}(Q_1 \cup Q_2, I_1 \wedge I_2, R_1 \wedge R_2, \mathcal{F}_1 \vee \mathcal{F}_2)$

Eliminate Nesting - Acceptance condition **must** be an automata of the same type

$\mathcal{A}_{\exists}(Q^1, I_1^1, R_1^1, \mathcal{A}_{\exists}(Q^2, I_2^2, R_2^2, \mathcal{F}_1))$

CTL* Modelchecking to LTL model checking

Let's φ_i be a pure path formula (without path quantifiers), Ψ be a propositional formula, abbreviate subformulas $E\varphi$ and $A\psi$ working bottom-up the syntax tree to obtain the following

$$\text{normal form: } \Phi = \text{let } \begin{bmatrix} x_1 = A\varphi_1 \\ \vdots \\ x_n = A\varphi_n \end{bmatrix} \text{ in } \Psi \text{ end}$$

Use LTL model checking to compute
 $Q_i := \llbracket A\varphi_i \rrbracket_{\mathcal{K}_{i-1}}$, where $\mathcal{K}_0 := \mathcal{K}$ and \mathcal{K}_{i+1} is obtained from \mathcal{K}_i by labelling the states Q_i with x_i .
Finally compute $\llbracket \Psi \rrbracket_{\mathcal{K}_n}$
