

Propositional Logic - Syntactic Sugar

$\varphi \Leftrightarrow \psi := (\neg\varphi \vee \psi) \wedge (\neg\psi \vee \varphi)$ $\varphi \rightarrow \psi := \neg\varphi \vee \psi$

$\varphi \oplus \psi := (\varphi \wedge \neg\psi) \vee (\psi \wedge \neg\varphi)$ $\varphi \bar{\wedge} \psi := \neg(\varphi \wedge \psi)$

$(\alpha \Rightarrow \beta | \gamma) := (\neg\alpha \vee \beta) \wedge (\alpha \vee \gamma)$ $\varphi \bar{\vee} \psi := \neg(\varphi \vee \psi)$

Satisfiability, Validity and Equivalence

$\text{SAT}(\varphi) := \neg \text{VALID}(\neg\varphi)$ $\varphi \Leftrightarrow \psi := \text{VALID}(\varphi \leftrightarrow \psi)$

$\text{VALID}(\varphi) := (\varphi \Leftrightarrow 1)$ $\text{SAT}(\varphi) := \neg(\varphi \Leftrightarrow 0)$.

Conjunctive Normal Form: from truth table, take minterms that are 0. Each minterm is built as an OR of the negated variables. E.g.,

$(0, 0, 1) \rightarrow (x \vee y \vee \neg z)$.

Distributivity: $a \wedge (b \vee c) = (a \wedge b) \vee (a \wedge c)$

$a \vee (b \wedge c) = (a \vee b) \wedge (a \vee c)$

Sequent Calculus:

1. Prove validity of ϕ : start with $\{\} \vdash \phi$; ϕ is valid iff $\Gamma \cap \Delta \neq \{\}$ for all leaves; else, counterexample: var is true, if $x \in \Gamma$; false otherwise; "don't care", if variable doesn't appear.
2. Prove satisfiability of ϕ : start with $\{\phi\} \vdash \{\}$; ϕ is satisfiable iff $\Gamma \cap \Delta = \{\}$ for at least one leaf. Satisfying interpretation: same as counterexample.

OPER.	LEFT	RIGHT
NOT	$\neg\phi, \Gamma \vdash \Delta$ $\Gamma \vdash \phi, \Delta$	$\Gamma \vdash \neg\phi, \Delta$ $\neg\phi, \Gamma \vdash \Delta$
AND	$\phi \wedge \psi, \Gamma \vdash \Delta$ $\phi, \psi, \Gamma \vdash \Delta$	$\Gamma \vdash \phi \wedge \psi, \Delta$ $\Gamma \vdash \phi, \Delta \quad \Gamma \vdash \psi, \Delta$
OR	$\phi \vee \psi, \Gamma \vdash \Delta$ $\phi, \Gamma \vdash \Delta \quad \psi, \Gamma \vdash \Delta$	$\Gamma \vdash \phi \vee \psi, \Delta$ $\Gamma \vdash \phi, \psi, \Delta$

Resolution Calculus

$\frac{\{ \neg x \} \cup C_1 \quad \{ x \} \cup C_2}{C_1 \cup C_2}$
To prove unsatisfiability of given clauses in CNF: If we reach $\{\}$, the formula is unsatisfiable. E.g., $\{\{a\}, \{\neg a, b\}, \{\neg b\}\}$, we get:

$\{a\} + \{\neg a, b\} \rightarrow \{b\}$; $\{b\} + \{\neg b\} \rightarrow \{\}$ (unsatisfiable).

To prove validity, prove UNSAT of negated formula.

Linear Clause Forms (Computes CNF)

Bottom up in the syntax tree: convert "operators and variables" into new variable. E.g., $\neg a \vee b$ becomes $x_1 \leftrightarrow \neg a$; $x_2 \leftrightarrow x_1 \vee b$. Use rules below to find CNF.

$$x \leftrightarrow \neg y \Leftrightarrow (\neg x \vee \neg y) \wedge (x \vee y)$$

$$x \leftrightarrow y_1 \wedge y_2 \Leftrightarrow (\neg x \vee y_1) \wedge (\neg x \vee y_2) \wedge (x \vee \neg y_1 \vee \neg y_2)$$

$$x \leftrightarrow y_1 \vee y_2 \Leftrightarrow (\neg x \vee y_1 \vee y_2) \wedge (x \vee \neg y_1) \wedge (x \vee \neg y_2)$$

$$x \leftrightarrow y_1 \rightarrow y_2 \Leftrightarrow (x \vee y_1) \wedge (x \vee \neg y_1 \vee \neg y_2) \wedge (\neg x \vee \neg y_1 \vee y_2)$$

$$x \leftrightarrow (y_1 \leftrightarrow y_2) \Leftrightarrow (x \vee y_1 \vee y_2) \wedge (x \vee \neg y_1 \vee \neg y_2) \wedge (\neg x \vee y_1 \vee \neg y_2) \wedge (\neg x \vee \neg y_1 \vee y_2)$$

$$x \leftrightarrow y_1 \oplus y_2 \Leftrightarrow (x \vee \neg y_1 \vee y_2) \wedge (x \vee y_1 \vee \neg y_2) \wedge (\neg x \vee y_1 \vee y_2) \wedge (\neg x \vee \neg y_1 \vee \neg y_2)$$

Davis Putnam Procedure - proves SAT; To prove validity: prove unsatisfiability of negated formula. (1) Compute Linear Clause Form

(Don't forget to create the last clause $\{x_n\}$) (2) Last variable has to be \perp (true) \rightarrow find implied variables.

(3) For remaining variables: assume values and

compute newly implied variables. (4) If contradiction reached: backtrack.

<pre> Apply(⊙, BddNode a, b) int m; BddNode h, l; if isLeaf(a)&isLeaf(b) then return Eval(⊙, label(a), label(b)); else m=max(label(a),label(b)) (a0,a1):=Ops(a,m); (b0,b1):=Ops(b,m); h:=Apply(⊙,a1,b1); l:=Apply(⊙,a0,b0); return CreateNode(m,h,l) end; </pre>	<pre> Compose(int x, BddNode ψ, α) int m; BddNode h, l; if x>label(ψ) then return ψ; elseif x=label(ψ) then return ITE(α,high(ψ), low(ψ)); else m=max{label(ψ),label(α)}; (α0,α1):=Ops(α, m); (ψ0,ψ1):=Ops(ψ, m); h:=Compose(x,ψ1,α1); l:=Compose(x,ψ0,α0); return CreateNode(m,h,l) endif; end </pre>

Simulation:

given $K_1 = (\mathcal{I}_1, \mathcal{S}_1, \mathcal{R}_1, \mathcal{L}_1)$ and $K_2 = (\mathcal{I}_2, \mathcal{S}_2, \mathcal{R}_2, \mathcal{L}_2)$; $\sigma \subseteq \mathcal{S}_1 \times \mathcal{S}_2$ is a sim. relation between K_1 and K_2 ($K_1 \preceq K_2$) if: **SIM1-** $(s_1, s_2) \in \sigma$ implies $\mathcal{L}_1(s_1) = \mathcal{L}_2(s_2)$; **SIM2-** for $s_1, s'_1 \in \mathcal{S}_1, s_2 \in \mathcal{S}_2$ with $(s_1, s_2) \in \sigma$ and $(s_1, s'_1) \in \mathcal{R}_1$, there must be $s'_2 \in \mathcal{S}_2$ with $(s'_1, s'_2) \in \sigma$ ($s_2, s'_2 \in \mathcal{S}_2$); **SIM3-** for all $s_1 \in \mathcal{I}_1$, there is a $s_2 \in \mathcal{I}_2$ with $(s_1, s_2) \in \sigma$.

Greatest Simulation Relation

$(s_1, s_2) \in \mathcal{H}_0 \Leftrightarrow \mathcal{L}_1(s_1) = \mathcal{L}_2(s_2)$

$(s_1, s_2) \in \mathcal{H}_{i+1} \Leftrightarrow$

$\left(\begin{array}{l} (s_1, s_2) \in \mathcal{H}_i \wedge \\ \forall s'_1 \in \mathcal{S}_1. \exists s'_2 \in \mathcal{S}_2. \\ (s_1, s'_1) \in \mathcal{R}_1 \rightarrow (s_2, s'_2) \in \mathcal{R}_2 \wedge (s'_1, s'_2) \in \mathcal{H}_i \end{array} \right)$

\mathcal{H}_* is the greatest simulation relation if **SIM3:** $\mathcal{I}_1 \subseteq \{s_1 \in \mathcal{S}_1 | \exists s_2 \in \mathcal{I}_2. (s_1, s_2) \in \mathcal{H}_*\}$

Bisimulation: $\sigma \subseteq \mathcal{S}_1 \times \mathcal{S}_2$ is a bisim. relation between K_1 and K_2 ($K_1 \approx K_2$) if: **BISIM1-** $(s_1, s_2) \in \sigma$ implies $\mathcal{L}_1(s_1) = \mathcal{L}_2(s_2)$; **BISIM2a-**

$(s_1, s'_1 \in \mathcal{S}_1, s_2 \in \mathcal{S}_2, (s_1, s_2) \in \sigma, (s_1, s'_1) \in \mathcal{R}_1$, imply that there is $s'_2 \in \mathcal{S}_2$ with $(s'_1, s'_2) \in \sigma$ and $(s_2, s'_2) \in \mathcal{R}_2$; **BISIM2b-** $s_2, s'_2 \in \mathcal{S}_2, s_1 \in \mathcal{S}_1, (s_1, s_2) \in \sigma, (s_2, s'_2) \in \mathcal{R}_2$, imply that there is $s'_1 \in \mathcal{S}_1$ with $(s'_1, s'_2) \in \sigma$ and $(s_1, s'_1) \in \mathcal{R}_1$; **BISIM3a-** for all $s_1 \in \mathcal{I}_1$, there is a $s_2 \in \mathcal{I}_2$ with $(s_1, s_2) \in \sigma$; **BISIM3b-** for all $s_1 \in \mathcal{I}_2$, there is a $s_2 \in \mathcal{I}_2$ with $(s_1, s_2) \in \sigma$.

Greatest Bisimulation Relation (Equivalence)

$(s_1, s_2) \in \mathcal{B}_0 \Leftrightarrow \mathcal{L}_1(s_1) = \mathcal{L}_2(s_2)$

$(s_1, s_2) \in \mathcal{B}_{i+1} \Leftrightarrow$

$\left(\begin{array}{l} (s_1, s_2) \in \mathcal{B}_i \wedge \\ \forall s'_1 \in \mathcal{S}_1. \exists s'_2 \in \mathcal{S}_2. \\ (s_1, s'_1) \in \mathcal{R}_1 \rightarrow (s_2, s'_2) \in \mathcal{R}_2 \wedge (s'_1, s'_2) \in \mathcal{B}_i \\ \forall s'_2 \in \mathcal{S}_2. \exists s'_1 \in \mathcal{S}_1. \\ (s_2, s'_2) \in \mathcal{R}_2 \rightarrow (s_1, s'_1) \in \mathcal{R}_1 \wedge (s'_1, s'_2) \in \mathcal{B}_i \end{array} \right)$

\mathcal{B}_* is the greatest simulation relation if

$\mathcal{I}_1 \subseteq \{s_1 \in \mathcal{S}_1 | \exists s_2 \in \mathcal{I}_2. (s_1, s_2) \in \mathcal{B}_*\}$

$\mathcal{I}_2 \subseteq \{s_2 \in \mathcal{S}_2 | \exists s_1 \in \mathcal{I}_1. (s_1, s_2) \in \mathcal{B}_*\}$

Quotient: given $\mathcal{K} = (\mathcal{I}, \mathcal{S}, \mathcal{R}, \mathcal{L})$ and the equivalence relation $\sigma \subseteq \mathcal{S} \times \mathcal{S}$; Quotient structure

$\mathcal{K}_{/\sigma} = (\tilde{\mathcal{I}}, \tilde{\mathcal{S}}, \tilde{\mathcal{R}}, \tilde{\mathcal{L}})$: $\tilde{\mathcal{I}} := \{\{s' \in \mathcal{S} | (s, s') \in \sigma\} | s \in \mathcal{I}\}$

$\tilde{\mathcal{S}} := \{\{s' \in \mathcal{S} | (s, s') \in \sigma\} | s \in \mathcal{S}\}$

$(\tilde{s}_1, \tilde{s}_2) \in \tilde{\mathcal{R}} : \Leftrightarrow \exists s'_1 \in \tilde{s}_1. \exists s'_2 \in \tilde{s}_2. (s'_1, s'_2) \in \mathcal{R}$

$\tilde{\mathcal{L}}(\tilde{s}) := \mathcal{L}(s)$

Symbolic Product Computation - given

$\mathcal{K}_1 = (\mathcal{V}_1, \varphi_{\mathcal{I}}, \varphi_{\mathcal{R}})$ and $\mathcal{K}_2 = (\mathcal{V}_2, \psi_{\mathcal{I}}, \psi_{\mathcal{R}})$, the product is: $\mathcal{K}_1 \times \mathcal{K}_2 = (\mathcal{V}_1 \cup \mathcal{V}_2, \varphi_{\mathcal{I}} \wedge \psi_{\mathcal{I}}, \varphi_{\mathcal{R}} \wedge \psi_{\mathcal{R}})$

Quantif. $\exists x. \varphi := [\varphi]_x^1 \vee [\varphi]_x^0 \quad \forall x. \varphi := [\varphi]_x^1 \wedge [\varphi]_x^0$

Predecessor and Successor

$\diamond := \text{pre}_{\mathcal{R}}^{\mathcal{R}}(Q) := \exists x'_1, \dots, x'_n. \varphi_{\mathcal{R}} \wedge [\varphi_Q]_{x'_1, \dots, x'_n}^{x_1, \dots, x_n}$

$\bar{\diamond} := \text{suc}_{\mathcal{R}}^{\mathcal{R}}(Q) := \exists x_1, \dots, x_n. \varphi_{\mathcal{R}} \wedge \varphi_Q]_{x_1, \dots, x_n}^{x'_1, \dots, x'_n}$

$\square := \text{pre}_{\mathcal{V}}^{\mathcal{R}}(Q) := \forall x'_1, \dots, x'_n. \varphi_{\mathcal{R}} \rightarrow [\varphi_Q]_{x'_1, \dots, x'_n}^{x_1, \dots, x_n}$

$\bar{\square} := \text{suc}_{\mathcal{V}}^{\mathcal{R}}(Q) := \forall x_1, \dots, x_n. \varphi_{\mathcal{R}} \rightarrow \varphi_Q]_{x_1, \dots, x_n}^{x'_1, \dots, x'_n}$

$\text{pre}_{\mathcal{V}}^{\mathcal{R}}(Q = \{S_1, \dots, S_n\})$ for each node n in \mathcal{K} : if(n points to a node that is not in Q) n $\notin \text{pre}_{\mathcal{V}}^{\mathcal{R}}(Q)$ else n $\in \text{pre}_{\mathcal{V}}^{\mathcal{R}}(Q)$	$\text{suc}_{\mathcal{V}}^{\mathcal{R}}(Q = \{S_1, \dots, S_n\})$ for each node n in \mathcal{K} : if(n is pointed by a node that is not in Q) n $\notin \text{suc}_{\mathcal{V}}^{\mathcal{R}}(Q)$ else n $\in \text{suc}_{\mathcal{V}}^{\mathcal{R}}(Q)$

Tarski-Knaster Theorem: $\mu :=$ starts $\perp \rightarrow$

least fixpoint $\spadesuit \nu :=$ starts $\top \rightarrow$ greatest fixpoint *

Rabin-Scott Subset Construction 1. Initial

state is a set of states containing all the initial states. **2.** For all transitions of a set of states, compute the successors and create a set of states containing all the possible reachable states when performing that transition. **3.** Acceptance condition are set of states containing acceptance states.

Local Model Checking

$\frac{\text{st-}\varphi \wedge \psi}{\{ \text{st-}\varphi \}} \wedge$	$\frac{\text{st-}\varphi \vee \psi}{\{ \text{st-}\varphi \} \cup \{ \text{st-}\psi \}} \vee$
$\frac{\text{st-}\varphi \sqcup \psi}{\{ \text{st}_1 \vdash \varphi \} \dots \{ \text{st}_n \vdash \varphi \}} \wedge$	$\frac{\text{st-}\varphi \odot \psi}{\{ \text{st}_1 \vdash \varphi \} \dots \{ \text{st}_n \vdash \varphi \}} \vee$
$\frac{\text{st-}\varphi \sqcup \psi}{\{ \text{st}'_1 \vdash \varphi \} \dots \{ \text{st}'_n \vdash \varphi \}} \wedge$	$\frac{\text{st-}\varphi \odot \psi}{\{ \text{st}'_1 \vdash \varphi \} \dots \{ \text{st}'_n \vdash \varphi \}} \vee$
$\frac{\text{st-}\varphi \mu x. \varphi}{\text{st-}\varphi}$	$\frac{\text{st-}\varphi \nu x. \varphi}{\text{st-}\varphi}$
$\frac{\text{st-}\varphi}{\text{st-}\varphi \mathcal{Q}_{\Phi}(x)}$	$\frac{\mathcal{Q}_{\Phi}(\text{replace w. initial form.})}{\text{st-}\varphi \mathcal{Q}_{\Phi}(x)}$
$\{s_1 \dots s_n\} = \text{suc}_{\mathcal{R}}^{\mathcal{R}}(s)$ and $\{s'_1 \dots s'_n\} = \text{pre}_{\mathcal{R}}^{\mathcal{R}}(s)$	

Approximations and Ranks

If $(s, \mu x. \varphi)$ repeats \rightarrow return 0	$\text{apx}_0(\mu x. \varphi) := 0$
If $(s, \nu x. \varphi)$ repeats \rightarrow return 1	$\text{apx}_0(\nu x. \varphi) := 1$
$\text{apx}_{n+1}(\mu x. \varphi) := \lfloor \varphi \rfloor_x^{\text{apx}_n(\mu x. \varphi)}$	
$\text{apx}_{n+1}(\nu x. \varphi) := \lfloor \varphi \rfloor_x^{\text{apx}_n(\nu x. \varphi)}$	

Automata types: G \rightarrow Safety; F \rightarrow Liveness; FG \rightarrow Persistence/Co-Buchi; GF \rightarrow Fairness/Buchi.

Automaton Determinization

NDet_G \rightarrow Det_G: 1. Remove all states/edges that do not satisfy acceptance condition; 2. Use Subset construction (Rabin-Scott); 3. Acceptance condition will be the states where $\{\}$ is never reached.

{NDet_F(partial) or NDet_{prefix}} \rightarrow Det_{FG}: Breakpoint Construction.

NDet_F(total) \rightarrow Det_F: Subset Construction.

NDet_{FG} \rightarrow Det_{FG}: Breakpoint Construction.

NDet_{GF} \rightarrow {Det_{Rabin} or Det_{Streett}}: Safra Algorithm.

* Breakpoint Construction 1. Each state is composed by two components

2. Initial state first component is a set of all initial states, and second component is the empty set. Ex.: $(\mathcal{I}, \{\})$.

3. a successor for a state (Q, Q_f) is generated as follows:

$\left\{ \begin{array}{l} \text{If } Q_f = \{\} \quad (\text{suc}_{\mathcal{R}}^{\mathcal{R}a}(Q), (\text{suc}_{\mathcal{R}}^{\mathcal{R}a}(Q) \cap \mathcal{F})) \\ \text{Otherwise} \quad (\text{suc}_{\mathcal{R}}^{\mathcal{R}a}(Q), (\text{suc}_{\mathcal{R}}^{\mathcal{R}a}(Q_f) \cap \mathcal{F})) \end{array} \right.$

4. Acceptance states are states where $Q_f \neq \{\}$.

Boolean Operations on ω -Automata

Complement

$$\neg \mathcal{A}_{\forall}(Q, \mathcal{I}, \mathcal{R}, \mathcal{F}) = \mathcal{A}_{\exists}(Q, \mathcal{I}, \mathcal{R}, \neg \mathcal{F})$$

$$\neg \mathcal{A}_{\exists}(Q, \mathcal{I}, \mathcal{R}, \mathcal{F}) = \mathcal{A}_{\forall}(Q, \mathcal{I}, \mathcal{R}, \neg \mathcal{F})$$

Conjunction

$$(\mathcal{A}_{\exists}(Q_1, \mathcal{I}_1, \mathcal{R}_1, \mathcal{F}_1) \wedge \mathcal{A}_{\exists}(Q_2, \mathcal{I}_2, \mathcal{R}_2, \mathcal{F}_2)) = \mathcal{A}_{\exists}(Q_1 \cup Q_2, \mathcal{I}_1 \wedge \mathcal{I}_2, \mathcal{R}_1 \wedge \mathcal{R}_2, \mathcal{F}_1 \wedge \mathcal{F}_2)$$

Disjunction

$$(\mathcal{A}_{\exists}(Q_1, \mathcal{I}_1, \mathcal{R}_1, \mathcal{F}_1) \vee \mathcal{A}_{\exists}(Q_2, \mathcal{I}_2, \mathcal{R}_2, \mathcal{F}_2)) = \mathcal{A}_{\exists}(Q_1 \cup Q_2, \mathcal{I}_1 \wedge \mathcal{I}_2, \mathcal{R}_1 \wedge \mathcal{R}_2, \mathcal{F}_1 \vee \mathcal{F}_2)$$

$$\mathcal{A}_{\exists} \left(\begin{array}{l} Q_1 \cup Q_2 \cup \{q\}, \\ (\neg q \wedge \mathcal{I}_1) \vee (q \wedge \mathcal{I}_2), \\ (\neg q \wedge \mathcal{R}_1 \wedge \neg q') \vee (q \wedge \mathcal{R}_2 \wedge q'), \\ (\neg q \wedge \mathcal{F}_1) \vee (q \wedge \mathcal{F}_2) \end{array} \right)$$

If both automata are totally defined,

$$(\mathcal{A}_{\exists}(Q_1, \mathcal{I}_1, \mathcal{R}_1, \mathcal{F}_1) \vee \mathcal{A}_{\exists}(Q_2, \mathcal{I}_2, \mathcal{R}_2, \mathcal{F}_2)) = \mathcal{A}_{\exists}(Q_1 \cup Q_2, \mathcal{I}_1 \wedge \mathcal{I}_2, \mathcal{R}_1 \wedge \mathcal{R}_2, \mathcal{F}_1 \vee \mathcal{F}_2)$$

Eliminate Nesting - Acceptance condition **must** be an automata of the same type

$$\mathcal{A}_{\exists}(Q^1, \mathcal{I}_1^1, \mathcal{R}_1^1, \mathcal{A}_{\exists}(Q^2, \mathcal{I}_2^2, \mathcal{R}_2^2, \mathcal{F}_1)) = \mathcal{A}_{\exists}(Q^1 \cup Q^2, \mathcal{I}_1^1 \wedge \mathcal{I}_2^2, \mathcal{R}_1^1 \wedge \mathcal{R}_2^2, \mathcal{F}_1))$$

Boolean Operations of G

$$(1) \neg G\varphi = F \neg \varphi \quad (2) G\varphi \wedge G\psi = G[\varphi \wedge \psi]$$

$$(3) G\varphi \vee G\psi = \mathcal{A}_{\exists}(\{p, q\}, p \wedge q, [p' \leftrightarrow p \wedge \varphi] \wedge [q' \leftrightarrow q \wedge \psi], G[p \vee q])$$

$$\begin{array}{ll} (1) \neg F\varphi = G\neg\varphi & (2) F\varphi \vee F\psi = F[\varphi \vee \psi] \\ (3) F\varphi \wedge F\psi = \mathcal{A}_{\exists}(\{p, q\}, \neg p \wedge \neg q, & \\ & [p' \leftrightarrow p \vee \varphi] \wedge [q' \leftrightarrow q \vee \psi], F[p \wedge q]) \end{array}$$

$$\begin{array}{l} (1) \neg FG\varphi = GF\neg\varphi \quad (2) FG\varphi \wedge FG\psi = FG[\varphi \wedge \psi] \\ (3) FG\varphi \vee FG\psi = A_{\exists}(\{q\}, \neg q, q' \leftrightarrow (q \Rightarrow \psi | \neg\varphi), \\ \quad FG[\neg q \vee \psi]) \end{array}$$

$$\begin{array}{l} (1) \neg GF\varphi = FG\neg\varphi \quad (2) GF\varphi \vee GF\psi = GF[\varphi \vee \psi] \\ (3) GF\varphi \wedge GF\psi = A_{\exists}(\{q\}, \neg q, q' \leftrightarrow (q \Rightarrow \neg\psi|\varphi), \\ \quad GF[q \wedge \psi]) \end{array}$$

Reduction of G

$$G\varphi = \mathcal{A}_\exists(\{q\}, q, \varphi \wedge q \wedge q', Fq))$$

$$G\varphi = \mathcal{A}_\exists(\{q\}, q, q' \leftrightarrow q \wedge \varphi, FGq)$$

Reduction of F
 $F\varphi$ can **not** be expressed by $NDet_G$
 $F\varphi = A\exists(\{q\}, \neg q, q' \leftrightarrow q \vee \varphi, FGq)$

Reduction of FG
 $FG\varphi$ can **not** be expressed by $NDet_G$
 $FG\varphi = \mathcal{A}_{\exists}(\{q\}, \neg q, q \rightarrow \varphi \wedge q', Fq)$

$$FG\varphi = \mathcal{A}_\exists \left(\begin{array}{c} \{p, q\}, \quad \neg p \wedge \neg q, \\ \left[\begin{array}{c} (p \rightarrow p') \wedge (p' \rightarrow p \vee \neg q) \wedge \\ (q' \leftrightarrow (p \wedge \neg q \vee \neg \varphi)) \vee (p \wedge q) \end{array} \right] \\ G\neg q \wedge Fp \end{array} \right),$$

$$FG\varphi = \mathcal{A}_\exists \left(\begin{array}{c} \{p, q\}, \quad \neg p \wedge \neg q, \\ \left[\begin{array}{c} (p \rightarrow p') \wedge (p' \rightarrow p \vee \neg q) \wedge \\ (q' \leftrightarrow (p \wedge \neg q \vee \neg \varphi)) \vee (p \wedge q) \end{array} \right] \\ GF[p \wedge \neg q] \end{array} \right)$$

E and A quantify over infinite paths.
 $A\varphi$ holds on every state that has no infinite path;
 $E\varphi$ is false on every state that has no infinite path;
 $A0$ holds on states with only finite paths;
 $E1$ is false on state with only finite paths;
 $\Box 0$ holds on states with no successor states;
 $\Diamond 1$ holds on states with successor states.

$$F\varphi = \varphi \vee XF\varphi \qquad G\varphi = \varphi \wedge XG\varphi$$

$$\begin{aligned} [\varphi U \psi] &= \psi \vee (\varphi \wedge X[\varphi U \psi]) \\ [\varphi B \psi] &= \neg\psi \wedge (\varphi \vee X[\varphi B \psi]) \\ [\varphi W \psi] &= (\psi \wedge \varphi) \vee (\neg\psi \wedge X[\varphi W \psi]) \end{aligned}$$

$\neg(\varphi \wedge \psi) = \neg\varphi \vee \neg\psi$	$\neg(\varphi \vee \psi) = \neg\varphi \wedge \neg\psi$

Let's φ_i be a pure path formula (without path quantifiers), Ψ be a propositional formula, abbreviate subformulas $E\varphi$ and $A\psi$ working bottom-up the syntax tree to obtain the following

normal form: $\phi = \text{let } \begin{bmatrix} x_1 = A\varphi_1 \\ \vdots \\ x_n = A\varphi_n \end{bmatrix} \text{ in } \Psi \text{ end}$

Use LTL model checking to compute $Q_i := \llbracket A\varphi_i \rrbracket_{\mathcal{K}_{i-1}}$, where $\mathcal{K}_0 := \mathcal{K}$ and \mathcal{K}_{i+1} is obtained from \mathcal{K}_i by labelling the states Q_i with x_i . Finally compute $\llbracket \Psi \rrbracket_{\mathcal{K}_n}$.

$$\Phi \equiv A\varphi, \text{ translate } \neg\varphi \text{ to an } \omega\text{-automaton } \mathfrak{A}_{\neg\varphi} = \mathfrak{A}_3(Q, \varphi_I, \varphi_R, \varphi_F). \text{ Thus:}$$
