Propositional Logic Syntactic Sugar

$\varphi \Leftrightarrow \psi := (\neg\varphi \vee \psi) \wedge (\neg\psi \vee \varphi)$ $\quad\varphi \to \psi := \neg\varphi \vee \psi$

$\varphi \oplus \psi := (\varphi \wedge \neg\psi) \vee (\psi \wedge \neg\varphi)$ $\quad\varphi \bar{\wedge} \psi := \neg(\varphi \wedge \psi)$

$(\alpha \Rightarrow \beta|\gamma) := (\neg\alpha \vee \beta) \wedge (\alpha \vee \gamma)$ $\quad\varphi \bar{\vee} \psi := \neg(\varphi \vee \psi)$

Distributivity: $a \wedge (b \vee c) = (a \wedge b) \vee (a \wedge c)$
$a \vee (b \wedge c) = (a \vee b) \wedge (a \vee c)$
De Morgan: $\neg(a \vee b) \equiv (\neg a \wedge \neg b)$
$\neg(a \wedge b) \equiv (\neg a \vee \neg b)$
CNF: from truth table, take minterms that are 0. Each minterm is built as an OR of the negated variables. E.g., $(0,0,1) \to (x \vee y \vee \neg z)$.

###SAT SOLVERS
Satisfiability, Validity and Equivalence

$\mathrm{SAT}(\varphi) := \neg\mathrm{VALID}(\neg\varphi)$ $\quad\varphi \Leftrightarrow \psi := \mathrm{VALID}(\varphi \leftrightarrow \psi)$
$\mathrm{VALID}(\varphi) := (\varphi \Leftrightarrow 1)$ $\quad\mathrm{SAT}(\varphi) := \neg(\varphi \Leftrightarrow 0)$.

Sequent Calculus:
-*Validity*: start with $\{\} \vdash \phi$; valid iff $\Gamma \cap \Delta \neq \{\}$ FOR ALL leaves.
-*Satisfiability*: start with $\{\phi\} \vdash \{\}$; satisfiable iff $\Gamma \cap \Delta = \{\}$ for AT LEAST ONE leaf.
-Counterexample/sat variable assignment: var is true, if $x \in \Gamma$; false otherwise; "don't care", if variable doesn't appear.

OPER.	LEFT	RIGHT
NOT	$\frac{\neg\phi,\Gamma\vdash\Delta}{\Gamma\vdash\phi,\Delta}$	$\frac{\Gamma\vdash\neg\phi,\Delta}{\phi,\Gamma\vdash\Delta}$
AND	$\frac{\phi\wedge\psi,\Gamma\vdash\Delta}{\phi,\psi,\Gamma\vdash\Delta}$	$\frac{\Gamma\vdash\phi\wedge\psi,\Delta}{\Gamma\vdash\phi,\Delta \quad \Gamma\vdash\psi,\Delta}$
OR	$\frac{\phi\vee\psi,\Gamma\vdash\Delta}{\phi,\Gamma\vdash\Delta \quad \psi,\Gamma\vdash\Delta}$	$\frac{\Gamma\vdash\phi\vee\psi,\Delta}{\Gamma\vdash\phi,\psi,\Delta}$

Resolution Calculus $\frac{\{\neg x\}\cup C_1 \quad \{x\}\cup C_2}{C_1 \cup C_2}$

To prove unsatisfiability of given clauses in CNF: If we reach $\{\}$, the formula is unsatisfiable. E.g., $\{\{a\},\{\neg a, b\},\{\neg b\}\}$, we get: $\{a\}+\{\neg a, b\} \to \{b\}; \{b\}+\{\neg b\} \to \{\}$ (unsatisfiable). To prove validity, prove UNSAT of negated formula.

Davis Putnam Procedure - proves SAT; To prove validity: prove unsatisfiability of negated formula.
(1) Compute Linear Clause Form
(Don't forget to create the last clause $\{x_n\}$)
(2) Last variable has to be 1 (true) $\to$ find implied variables.
(3) For remaining variables: assume values and compute newly implied variables.
(4) If contradiction reached: backtrack.

Linear Clause Forms (Computes CNF) - Bottom up (inside out) in the syntax tree: convert "operators and variables" into new variable. E.g., $\neg a \vee b$ becomes $x_1 \leftrightarrow \neg a; x_2 \leftrightarrow x_1 \vee b$. Use rules below to find CNF. Create last clause {Xn}

$x \leftrightarrow \neg y \Leftrightarrow (\neg x \vee \neg y) \wedge (x \vee y)$
$x \leftrightarrow y_1 \wedge y_2 \Leftrightarrow$
$\quad(\neg x \vee y_1) \wedge (\neg x \vee y_2) \wedge (x \vee \neg y_1 \vee \neg y_2)$
$x \leftrightarrow y_1 \vee y_2 \Leftrightarrow$
$\quad(\neg x \vee y_1 \vee y_2) \wedge (x \vee \neg y_1) \wedge (x \vee \neg y_2)$
$x \leftrightarrow y_1 \to y_2 \Leftrightarrow$
$\quad(x \vee y_1) \wedge (x \vee \neg y_1 \vee \neg y_2) \wedge (\neg x \vee \neg y_1 \vee y_2)$
$x \leftrightarrow (y_1 \leftrightarrow y_2) \Leftrightarrow (x \vee y_1 \vee y_2) \wedge (x \vee \neg y_1 \vee \neg y_2) \wedge$
$\quad(\neg x \vee y_1 \vee \neg y_2) \wedge (\neg x \vee \neg y_1 \vee y_2)$
$x \leftrightarrow y_1 \oplus y_2 \Leftrightarrow (x \vee \neg y_1 \vee y_2) \wedge (x \vee y_1 \vee \neg y_2) \wedge$
$\quad(\neg x \vee y_1 \vee y_2) \wedge (\neg x \vee \neg y_1 \vee \neg y_2)$

$\frac{s\vdash_\Phi \mu x.\varphi}{s\vdash_\Phi\varphi}$	$\frac{s\vdash_\Phi \nu x.\varphi}{s\vdash_\Phi\varphi}$	$\frac{s\vdash_\Phi x}{s\vdash_\Phi\mathfrak{D}_\Phi(x)}$	$\mathfrak{D}_\Phi$(replace w. initial form.)
$\{s_1 \dots s_n\} = suc_\exists^\mathcal{R}(s)$ and $\{s_1' \dots s_n'\} = pre_\exists^\mathcal{R}(s)$			

Approximations and Ranks

If (s,$\mu x.\varphi$) repeats$\to$return 0	$apx_0(\mu x.\varphi) := 0$
If (s,$\nu x.\varphi$) repeats$\to$return 1	$apx_0(\nu x.\varphi) := 1$

Tarski-Knaster Theorem: $\mu :=$ starts $\perp \rightarrow$ least fixpoint ♠ $\nu :=$ starts $\top \rightarrow$ greatest fixpoint

Quantif. $\exists x.\varphi := [\varphi]_x^1 \vee [\varphi]_x^0$ ♣ $\forall x.\varphi := [\varphi]_x^1 \wedge [\varphi]_x^0$

Predecessor and Successor

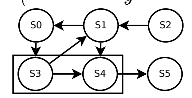
$\Diamond := pre_\exists^\mathcal{R}(Q) := \exists x_1', ..., x_n'.\varphi_\mathcal{R} \wedge [\varphi_Q]_{x_1,...,x_n}^{x_1',...,x_n'}$

$\overleftarrow{\Diamond} := suc_\exists^\mathcal{R}(Q) := [\exists x_1, ..., x_n.\varphi_\mathcal{R} \wedge \varphi_Q]_{x_1',...,x_n'}^{x_1,...,x_n}$

$\Box = pre_\forall^\mathcal{R}(Q) := \forall x_1', ..., x_n'.\varphi_\mathcal{R} \to [\varphi_Q]_{x_1,...,x_n}^{x_1',...,x_n'}$

$\overleftarrow{\Box} := suc_\forall^\mathcal{R}(Q) := [\forall x_1, ..., x_n.\varphi_\mathcal{R} \to \varphi_Q]_{x_1',...,x_n'}^{x_1,...,x_n}$

$\Diamond$*(Points to some in the set? Yes, enter!)*
$\overleftarrow{\Diamond}$*(Is pointed by some in the set? Yes, enter!)*
$\Box$*(Points to some outside the set? Yes, don't enter!)*
$\overleftarrow{\Box}$*(Pointed by some out the set? Yes, don't enter!)*



Example: $\Box/\overleftarrow{\Box}$

$pre_\forall^\mathcal{R}(\{S3,S4\}) = \{S0,S5\}$
$suc_\forall^\mathcal{R}(\{S3,S4\}) = \{S2,S5\}$

###AUTOMATA
Automata types: G$\to$Safety; F$\to$Liveness; FG$\to$Persistence/Co-Buchi; GF$\to$Fairness/Buchi.
Automaton Determinization
$\mathbf{NDet_G \to Det_G}$: 1.Remove all states/edges that do not satisfy acceptance condition; 2.Use Subset construction (Rabin-Scott); 3.Acceptance condition will be the states where {} is never reached.
$\mathbf{\{NDet_F (partial)\ or\ NDet_{prefix}\} \to Det_{FG}}$: Breakpoint Construction.
$\mathbf{NDet_F\ (total) \to Det_F}$: Subset Construction.
$\mathbf{NDet_{FG} \to Det_{FG}}$: Breakpoint Construction.
$\mathbf{NDet_{GF} \to \{Det_{Rabin}\ or\ Det_{Streett}\}}$: Safra Algorithm.

Boolean Operations on ω-Automata
Complement
$$\neg\mathcal{A}_\forall(Q,\mathcal{I},\mathcal{R},\mathcal{F}) = \mathcal{A}_\exists(Q,\mathcal{I},\mathcal{R},\neg\mathcal{F})$$
$$\neg\mathcal{A}_\exists(Q,\mathcal{I},\mathcal{R},\mathcal{F}) = \mathcal{A}_\forall(Q,\mathcal{I},\mathcal{R},\neg\mathcal{F})$$
Conjunction
$$(\mathcal{A}_\exists(Q_1,\mathcal{I}_1,\mathcal{R}_1,\mathcal{F}_1) \wedge \mathcal{A}_\exists(Q_2,\mathcal{I}_2,\mathcal{R}_2,\mathcal{F}_2)) =$$
$$\mathcal{A}_\exists(Q_1 \cup Q_2, \mathcal{I}_1 \wedge \mathcal{I}_2, \mathcal{R}_1 \wedge \mathcal{R}_2, \mathcal{F}_1 \wedge \mathcal{F}_2)$$
Disjunction
$$(\mathcal{A}_\exists(Q_1,\mathcal{I}_1,\mathcal{R}_1,\mathcal{F}_1) \vee \mathcal{A}_\exists(Q_2,\mathcal{I}_2,\mathcal{R}_2,\mathcal{F}_2)) =$$
$$\mathcal{A}_\exists\left(\begin{array}{c} Q_1 \cup Q_2 \cup \{q\}, \\ (\neg q \wedge \mathcal{I}_1) \vee (q \wedge \mathcal{I}_2), \\ (\neg q \wedge \mathcal{R}_1 \wedge \neg q') \vee (q \wedge \mathcal{R}_2 \wedge q'), \\ (\neg q \wedge \mathcal{F}_1) \vee (q \wedge \mathcal{F}_2) \end{array}\right)$$
If both automata are totally defined,
$$(\mathcal{A}_\exists(Q_1,\mathcal{I}_1,\mathcal{R}_1,\mathcal{F}_1) \vee \mathcal{A}_\exists(Q_2,\mathcal{I}_2,\mathcal{R}_2,\mathcal{F}_2)) =$$
$$\mathcal{A}_\exists(Q_1 \cup Q_2, \mathcal{I}_1 \wedge \mathcal{I}_2, \mathcal{R}_1 \wedge \mathcal{R}_2, \mathcal{F}_1 \vee \mathcal{F}_2)$$
Eliminate Nesting - Acceptance condition **must** be an automata of the same type
$$\mathcal{A}_\exists(Q^1,\mathcal{I}_1^1,\mathcal{R}_1^1,\mathcal{A}_\exists(Q^2,\mathcal{I}_1^2,\mathcal{R}_1^2,\mathcal{F}_1))$$
$$= \mathcal{A}_\exists(Q^1 \cup Q^2, \mathcal{I}_1^1 \wedge \mathcal{I}_1^2, \mathcal{R}_1^1 \wedge \mathcal{R}_1^2, \mathcal{F}_1))$$

###MONADIC PREDICATE

S1S: define 0 and its successors
LO2: $\mathbb{N}$ and comparison (i.e., $<, >$...)
Also have predicates, $\vee$, $\wedge$ and $\neg$.

###TRANSLATIONS

CTL* Modelchecking to LTL model checking

Let's φ_i be a pure path formula (without path quantifiers), Ψ be a propositional formula, abbreviate subformulas $E\varphi$ and $A\psi$ working bottom-up the syntax tree to obtain the following normal form: $\phi = \text{let} \begin{bmatrix} x_1 = A\varphi_1 \\ \vdots \\ x_n = A\varphi_n \end{bmatrix} \text{ in } \Psi \text{ end}$

Use LTL model checking to compute $Q_i := [\![A\varphi_i]\!]_{\mathcal{K}_{i-1}}$, where $\mathcal{K}_0 := \mathcal{K}$ and $\mathcal{K}_{i+1}$ is obtained from $\mathcal{K}_i$ by labelling the states Q_i with x_i. Finally compute $[\![\Psi]\!]_{\mathcal{K}_n}$

G and μ-calculus (safety property)

-$[\nu x.\varphi \wedge \Diamond x]_K$
-Contains states s where an infinite path π starts with $\forall t.\pi^{(t)} \in [\varphi]_K$
-φ holds always on π

F and μ-calculus (liveness property)

-$[\mu x.\varphi \vee \Diamond x]_K$
-Contains states s where a (possibly finite) path π starts with $\exists t.\pi^{(t)} \in [\varphi]_K$
-φ holds at least once on π

FG and μ-calculus (persistence property)

-$[\mu y.[\nu x.\varphi \wedge \Diamond x] \vee \Diamond y]_K$
-Contains states s where an infinite path π starts with $\exists t1.\forall t2.\pi^{(t1+t2)} \in [\varphi]_K$
-φ holds after some point on π

GF and μ-calculus (fairness property)

-$[\nu y.[\mu x.(y \wedge \varphi) \vee \Diamond x]]_K$
-Contains states s where an infinite path π starts with
$\forall t1.\exists t2.\pi^{(t1+t2)} \in [\varphi]_K ?????t1 + t2 or t1 + t0?????$
-φ holds infinitely often on π
